The trend of recorded cases globally shows that the highest figures were recorded in the **1st quarter of 2022**. Between December 2022 & January 2023, there was also an upsurge in covid-19 cases.

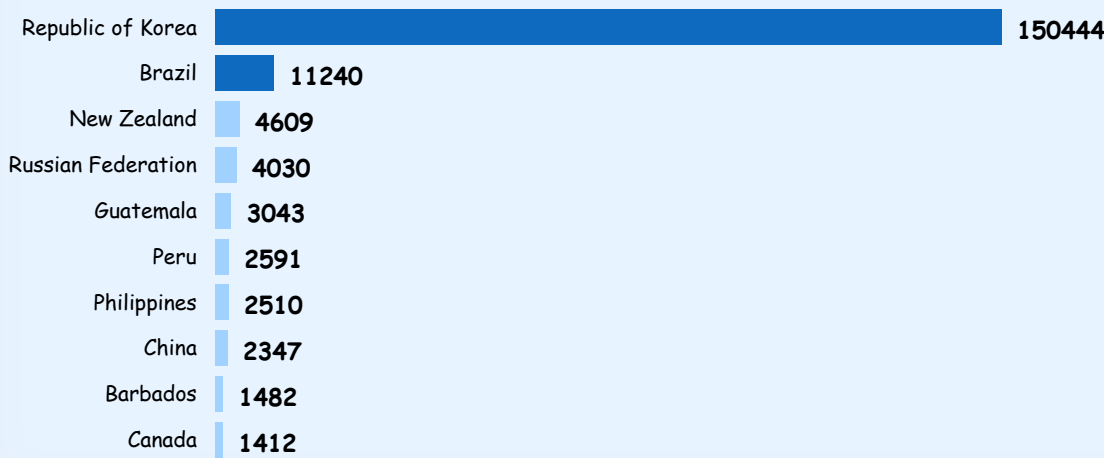

the highest covid figures have been recorded in the months of **December, January and February**. These are the coldest months in the top covid nations on record.

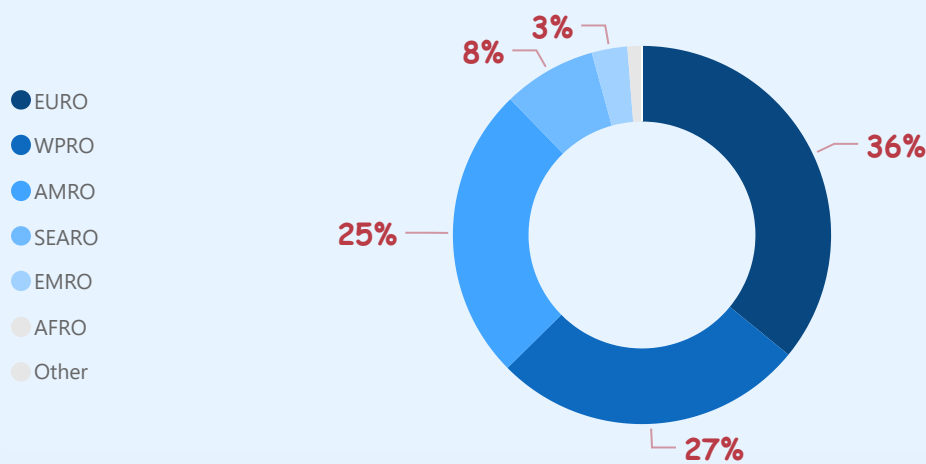

The United States & China currently have the highest cases on record. The US alone has recorded about **13%** of the total global figure

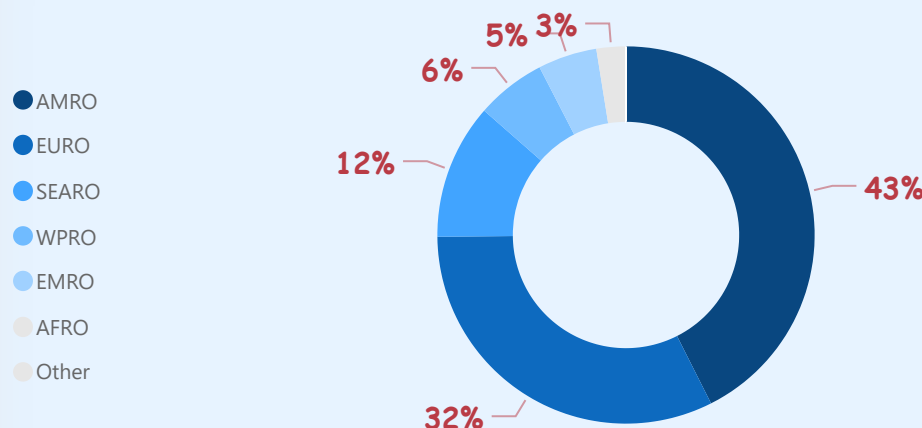

Republic of Korea has the highest cases on record in the **last 7 days**

Europe (EURO) and the **Western Pacific Region (WPRO)** have recorded the highest percentage of cases per W.H.O region

The **Region of the Americas (AMRO)** and **Europe (EURO)** have on record the highest death figures. Africa (AFRO) is lowest with **3%**

Globally, the highest death figures were recorded in the **1st Quarter of 2021** with a total death figure of about **445K**

The United states of America, Brazil & India have recorded the highest death figures. The US alone recorded **16%** of the total global deaths

CONCLUSION: Although Covid-19 is no longer considered a global health emergency. However, the trend still shows that cases were reported within the last 7days, indicating that the virus is around & here to stay (endemic). With new variants which could cause new surges in cases & deaths, countries are advised not to let down their guards. While transitioning from an emergency mode, it is highly recommended that a long term Covid-19 management plan be put in place. People are also advised to adhere to the Covid-19 guidelines where & when necessary. This is particularly important during the cold winter months of December, January & February which have been shown to be the peak months for Covid-19 spread in most parts of the World.
